- E. 4

**Answer: B**

**NEW QUESTION: 3**

- A. Option E
- B. Option B
- C. Option C
- D. Option A
- E. Option D

**Answer: B,C,D**

Explanation:

A: SESSION failover. When the connection to an instance is lost, SESSION failover results only in the establishment of a new connection to another Oracle RAC node; any work in progress is lost. SESSION failover is ideal for online transaction processing (OLTP) systems, where transactions are small.

C: SELECT failover. With SELECT failover, Oracle Net keeps track of all SELECT statements issued during the transaction, tracking how many rows have been fetched back to the client for each cursor associated with a SELECT statement. If the connection to the instance is lost, Oracle Net establishes a connection to another Oracle RAC node and re-executes the SELECT statements, repositioning the cursors so the client can continue fetching rows as if nothing has happened. The SELECT failover approach is best for data warehouse systems that perform complex and time-consuming transactions.

D: Oracle's answer to application failover is a new Oracle Net mechanism dubbed Transparent Application Failover. TAF allows the DBA to configure the type and method of failover for each Oracle Net client.

**NEW QUESTION: 4**

Which of the following best describes the purpose of

benchmarking?

- A. A means of comparing performance against a standard
- B. A means of assessing SPC results
- C. A means of cross-matching a delivery schedule
- D. A means of gaining negotiation advantages

**Answer: C**
