NEW QUESTION: 2

At which layer of the OSI model does the protocol that provides the information that is displayed by the show cdp neighbors command operate?

- A. physical
- B. application
- C. data link
- D. network
- E. transport

Answer: C

Explanation:

Explanation

CDP is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches) and allows network management applications to discover Cisco devices that are neighbors of already known devices. With CDP, network management applications can learn the device type and the Simple Network Management Protocol (SNMP) agent address of neighboring devices running lower-layer, transparent protocols. CDP allows devices to share basic configuration information without even configuring any protocol specific information and is enabled by default on all interfaces.

CDP is a Datalink Protocol occurring at Layer 2 of the OSI model.

CDP is not routable and can only go over to directly connected devices.

CDP is enabled, by default, on all Cisco devices. CDP updates are generated as multicasts every 60 seconds with a hold-down period of 180 seconds for a missing neighbor. The no cdp run command globally disables CDP, while the no cdp enable command disables CDP on an interface. Use show cdp neighbors to list out your directly connected Cisco neighboring devices. Adding the detail parameter will display the layer-3 addressing configured on the neighbor.

NEW QUESTION: 3

What does the following access list, which is applied on the external interface FastEthernet 1/0 of the perimeter router, accomplish?

- A.** It filters incoming traffic from private addresses in order to prevent spoofing and logs any intrusion attempts.
- B.** It prevents the internal network from being used in spoofed denial of service attacks and logs any exit to the Internet.
- C.** It prevents private internal addresses to be accessed directly from outside.
- D.** It prevents incoming traffic from IP address ranges 10.0.0.0-10.0.0.255, 172.16.0.0-172.31.255.255, 192.168.0.0-192.168.255.255 and logs any intrusion attempts.

Answer: A

Explanation:

Explanation/Reference:

Explanation:

The private IP address ranges defined in RFC 1918 are as follows:

10.0.0.0 - 10.255.255.255

172.16.0.0 - 172.31.255.255

192.168.0.0 - 192.168.255.255

These IP addresses should never be allowed from external networks into a corporate network as they would only be able to reach the network from the outside via routing problems or if the IP addresses were spoofed. This ACL is used to prevent all packets with a spoofed reserved private source IP address to enter the network. The log keyword also enables logging of this intrusion attempt.

NEW QUESTION: 4

Refer to the exhibit. HQ_MRGL is assigned to the HQ IP phones. BR_MRGL is assigned to the BR IP phones. The remote site BR IP phones support only the G.711 codec. Where should the transcoder reside?

- A.** The transcoder should be assigned to its own MRG, which should then be assigned to the default device pool.
- B.** The transcoder should reside at the HQ site and assigned to HQ_MRGL.
- C.** The transcoder should reside at the BR site and assigned to BR_MRGL.
- D.** A transcoder is not needed. The HQ phones will automatically change over to the G.711 codec.

Answer: C
